#### 1. INTRODUCTION

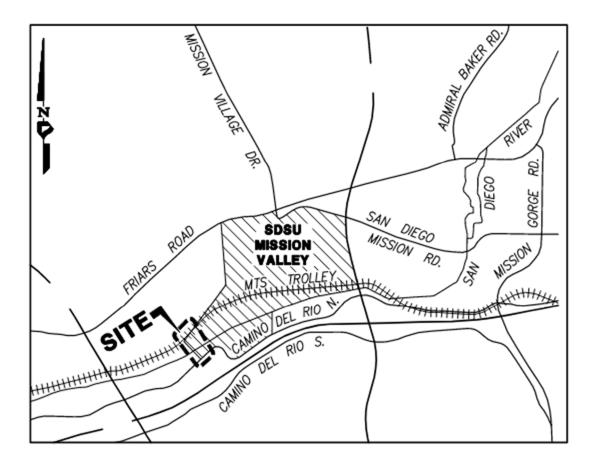

This preliminary drainage report has been prepared in support of the preliminary 30% design submittal for the Fenton Parkway Bridge development (the Project), which is located in the City of San Diego, California. The purpose of this report is to determine the hydrologic impact, if any, to the existing storm drain facilities or natural drainage, and to provide peak 100-year discharge values for the project.

The drainage analysis presented herein reflects a preliminary 30% design level-of-effort, which includes peak 100-year storm event hydrologic analyses using preliminary grades. Hydraulic analyses for inlets, pipe sizes and inverts, and HGL's will be provided during final engineering. Therefore, the purpose of this report submittal is to acquire from the City of San Diego: 1) concept approval of the proposed storm drain layout, 2) approval of the methodology used in the evaluation of the project storm drain system hydrology, and 3) identification of critical path drainage issues that need to be addressed during final engineering.

The Fenton Parkway Bridge Project is a bridge proposed to connect Fenton Parkway, which currently terminates north of the river channel, with Camino del Rio North, south of the river channel. The Fenton Parkway bridge (bridge) would span the San Diego River (river) in the Mission Valley community of the City of San Diego (City). The proposed bridge will be constructed on real property owned by the City of San Diego and upon the completion of construction, the City of San Diego will own, operate, and maintain the proposed bridge.

The proposed bridge is located in the northeast portion of the Mission Valley Community, in the central portion of the City of San Diego metropolitan area.

The vicinity map is shown in Figure 1.

#### Figure 1: Vicinity Map

Treatment of onsite storm water of the buildings prior to discharging into the downstream systems will be facilitated by a single biofiltration basin and a modular wetland unit. For a detailed discussion of the project's stormwater quality BMPs, refer to the Preliminary Stormwater Quality Management Plan (SWQMP) report. The final post-construction BMP design will be provided during final engineering.

This project is subject to the Clean Water Act (CWA) Sections 401 and 404 since there will be filling of material into an existing riparian streambed which converges with the San Diego River. Drainage from an existing storm drain system along Fenton Parkway and Mission City Parkway discharge into this streambed.

The project's storm drain system will discharge into the San Diego River. Refer to the FEMA Firm Panel in Appendix 1. FEMA shaded Zone AE and Zone X areas exist along the boundary of the project improvements.

## 2. EXISTING AND PROPOSED DRAINAGE PATTERNS AND IMPROVEMENTS

The following sections provide descriptions of the existing and proposed drainage patterns and improvements for the project.

### 2.1 Existing Drainage Patterns

There are two discharge locations for this project's drainage which are an existing 8'x7' reinforced concrete box (RCB) which transitions into a 96" reinforced concrete pipe (RCP) on Fenton Parkway that outfalls at the riprap lined streambed. On the the Mission City Parkway side of the San Diego River, the main line is a 54" RCP storm drain that outfall directly into the river.

Runon from Fenton Parkway is as follows:

Within Fenton Parkway, there are two storm drain laterals that connect to the RCB, an 18" RCP and a 36" RCP. Each lateral conveys drainage from a Type A-1 sag inlet. Both laterals have drainage connections that connect to the back of the inlets. In addition to the street drainage, the 18" RCP lateral conveys drainage from the Del Rio apartment complex and the 36" RCP conveys drainage from the Mission Valley Library and the IKEA loading dock entryway (Northside Drive). Furthermore, two modular wetland units collect runon at the intersection of River Park Road and half of Fenton Parkway which connect to the existing 96" RCP storm drain. Fenton Parkway is a crowned road, thus, at the intersection, the other half of the road drains down River Park Road to an existing Biofitration Basin. (See Appendix 4 for more information).

Runon from Mission City Parkway is as follows:

There is an existing high point from the existing bridge south of Mission City Parkway. Mission City Parkway is crowned. One side of the road drains to an existing curb inlet that connects into

an existing 54" RCP storm drain. The other side of the crowned street flows into the intersection of Camino Del Rio North and Mission City Parkway. Water then enters a 54" RCP system that discharges into the San Diego River.

The pre-project conditions for the Fenton Bridge project are represented by the post-project conditions of the Fenton proposed SDSU MISSION VALLEY- FENTON PARKWAY EXTENSION project, which extended Fenton Parkway through the trolley crossing per Public Improvement Plan (PRJ #1040531, DWG#100044-D). For further information about that project, refer to the previous approved drainage study for that project prepared by Project Design Consultants and dated November 15, 2022.

### 2.2 Proposed Drainage Improvements

The proposed drainage patterns will mimic the existing conditions with exception of more area included due to the addition of the Fenton Parkway Bridge. Under proposed conditions, the proposed bridge has a highpoint near the southern end. Therefore, runoff will be collected on both Mission City Parkway and Fenton Parkway.

Fenton Parkway bridge runoff will mimic the same path of travel with the exception of runoff draining to a biofiltration basin before entering the 96" RCP pipe that will be extended to drain closer to the river.

Mission City Parkway runoff will mimic the existing drainage patterns with the exception of an additional inlet that will be added to the western side of the crowned street. Runoff will then be treated in a proposed modular wetland system before entering the existing 54" RCP storm drain that will be relocated west of the proposed bridge.

The bridge will include deck drains to collect flows on the bridge to minimize gutter flow, but for this drainage study they are deemed insignificant in terms of high flows and due to potential inlet clogging. The proposed gutter flows on the bridge will comply with the City of San Diego flow depth requirements even without deck drains.

# 3. HYDROLOGY CRITERIA, METHODOLOGY, AND RESULTS

# 3.1 Hydrology Criteria

Table 1 summarizes the key assumptions and criteria used for the hydrologic modeling. See Table1 below.

Table	1: Hydrology	Criteria
-------	--------------	----------

Proposed Hydrology:	100-year storm frequency		
Soil Type:	Hydrologic Soil Group D		
Land Use / Runoff Coefficients:	Based on criteria presented in the <u>2017 City of San Diego</u> <u>Drainage Design Manual</u> .		
Rainfall intensity:	Based on intensity duration frequency relationships presented in the <u>2017 City of San Diego Drainage Design</u> <u>Manual</u>		

## 3.2 Hydrologic Methodology

Hydrology calculations were completed for proposed conditions accounting for all areas draining to the onsite storm drain systems. Drainage areas were defined from existing and proposed topographic maps of the area. Hydrologic analysis was completed utilizing the Rational Method, outlined in the 2017 City of San Diego Drainage Design Manual. The goal of the Rational Method analysis was to determine the peak 100-year flow rates for the storm drain pipes by developing a node link model of the contributing drainage area and applying the intensity-duration-frequency (IDF) curve to the areas. See Appendix 1 for the City of San Diego IDF curve.

The project drainage areas are represented with two overall systems draining to the same ultimate outfall area of concern. For the proposed condition, System 1000 represents the project site conveyed to the proposed Biofiltration Basin and System 2000 represents the project site conveyed to the east. (See Exhibits in Appendix 3 for details). Both systems discharge into the San Diego River.

Existing conditions calculations are not included in this report because they are unnecessary in terms of comparison. Comparison is not needed for this project because all runoff still mimics the existing condition of draining into the San Diego River. Thus, any minor increase of flow in the proposed condition is not deemed detrimental to the project.

It is essential to understand that the project outfalls are located in the floodplain for the San Diego River. The runoff from the proposed Fenton Parkway Bridge is negligible in size when compared to the flow of the San Diego River. The 100-year San Diego River flow is 36,000 cfs, whereas the areas analyzed in the onsite drainage study total only 8.3 cfs. Thus, any minor increases in flow due to the increase in imperviousness of the proposed bridge are deemed negligible.

Additionally, diversion is not a relevant design constraint, and 100-year detention is not warranted due to the location of the site within the larger San Diego River Watershed. The bridge outfalls are in the floodplain, therefore the option of providing 100-year detention is not relevant because of the high existing tailwater condition. Thus, an existing condition study is not needed.

Rather, for practical purposes, the proposed condition storm drain design will be designed to handle peak flow capacity without causing detrimental downstream effects. Both outfalls will be designed (pipe and riprap) to handle proposed flows.

City of San Diego Drainage Design Manual runoff coefficients, based on land use and anticipated imperviousness for each subarea, were assigned for each drainage sub-basin within CivilD.

# **3.3 Description of Hydrologic Modeling Software**

The Civil-D Rational Method Program was used to perform the Rational Method hydrologic calculations. This section provides a brief explanation of the computational procedure used in the computer model.

The Civil-D Modified Rational Method Hydrology Program is a computer-aided design program where the user develops a node link model of the watershed. Developing independent node link models for each interior watershed and linking these sub-models together at confluence points creates the node link model. The intensity-duration-frequency relationships are applied to each of the drainage areas in the model to get the peak flow rates at each point of interest.

## 3.4 Hydrology Results

The Rational Method was used to determine the peak 100-year storm flow rates for the design of the proposed onsite storm drain system. Table 2 below summarizes the Rational Method results for the proposed condition.

PROPOSED CONDITION					
SYSTEM	AREA (ac)	Q100 (cfs)	TC (min)		
1000	1.4	3.5	11.2		
2000	1.4	4.8	8.6		
TOTAL	2.8	8.3	19.8		

#### Table 2: Hydrology Results

#### 4. HYDRAULIC ANALYSIS

Hydraulic analyses provided during final engineering will include inlet sizing, HGL determination, spread calculations and riprap sizing.

#### 5. CONCLUSION

This drainage report supports the preliminary 30% design for the proposed Fenton Parkway Bridge development. This report was prepared to provide peak 100-year design flows for the project. The drainage system will be designed appropriately to accommodate the peak-flow conditions for the site.

# **APPENDIX 1**

# Intensity Duration Frequency Curve, Runoff Coefficients and FEMA Firmette

## APPENDIX A: RATIONAL METHOD AND MODIFIED RATIONAL METHOD

Land Use	Runoff Coefficient (C) Soil Type (1)	
Land Use		
Residential:		
Single Family	0.55	
Multi-Units	0.70	
Mobile Homes	0.65	
Rural (lots greater than ½ acre)	0.45	
Commercial (2)		
80% Impervious	0.85	
Industrial <sup>(2)</sup>		
90% Impervious	0.95	

#### Table A-1. Runoff Coefficients for Rational Method

#### Note:

<sup>(1)</sup> Type D soil to be used for all areas.

<sup>(2)</sup> Where actual conditions deviate significantly from the tabulated imperviousness values of 80% or 90%, the values given for coefficient C, may be revised by multiplying 80% or 90% by the ratio of actual imperviousness to the tabulated imperviousness. However, in case shall the final coefficient be less than 0.50. For example: Consider commercial property on D soil.

Actual imperviousness				50%
Tabulated imperviousness			Ξ	80%
<b>Revised</b> C	=	(50/80) x 0.85	=	0.53

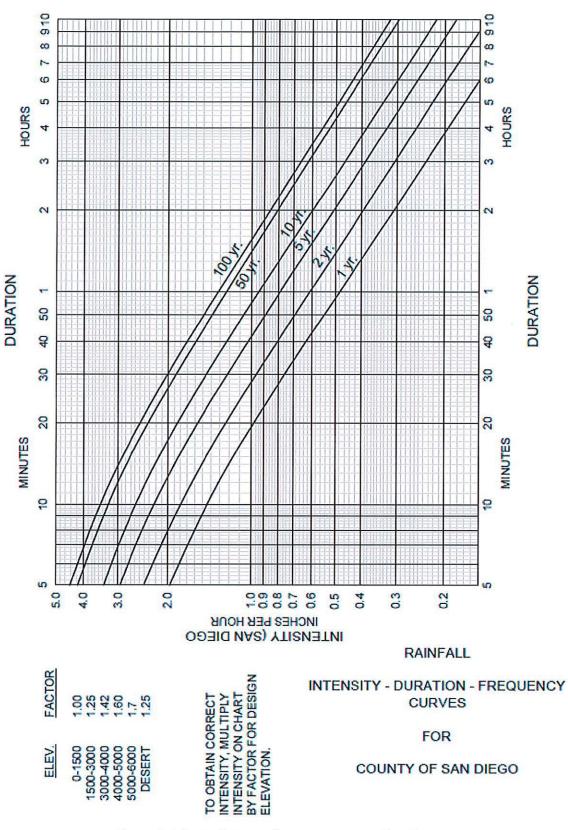

The values in Table A–1 are typical for urban areas. However, if the basin contains rural or agricultural land use, parks, golf courses, or other types of nonurban land use that are expected to be permanent, the appropriate value should be selected based upon the soil and cover and approved by the City.

# A.1.3. Rainfall Intensity

The rainfall intensity (I) is the rainfall in inches per hour (in/hr.) for a duration equal to the  $T_c$  for a selected storm frequency. Once a particular storm frequency has been selected for design and a  $T_c$  calculated for the drainage area, the rainfall intensity can be determined from the Intensity-Duration-Frequency Design Chart (Figure A-1).

#### APPENDIX A: RATIONAL METHOD AND MODIFIED RATIONAL METHOD

#### NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The community map repository should be consulted for ssible updated or additional flood hazard information

o obtain more detailed information in areas where Base Flood Flev ons (BEEs To obtain more detailed information in areas where Base Flood Elevations (BFC) and/or floodways have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) peor that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report shauld be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0" North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Sillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Sillwater Elevations table should be used for construction nd/or floodplain management purposes when they are higher than the elevations now on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report and the section of the

Certain areas not in Special Flood Hazard Areas may be protected by **flood control** structures. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The projection used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 11. The horizontal datum was NAD83, GRS1980 spherold. Differences in datum, spherold, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy

Flood elevations on this map are referenced to the North American Vertical Datum of 1998. These flood elevations must be compared to structure and ground elevations referenced to the same vertical datum. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following ardress:

NGS Information Services NOAA, N/NGS12 National Geodetic Survey SSMC-3, #9202 1315 East-West Highway Silver Spring, Maryland 20910-3282 (301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242 or visit its website at <u>http://www.ngs.noaa.gov/</u>.

Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). this information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed Map Index for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the FEMA Map Service Center at 1-877-FEMA MAP (1-877-336-2627) for information on available products associated with this FIRM. Available products may include products associated with this FIRM. Available products in include previously issued Letters of Mag. Change, a Flood Insurance Study report and/or digital versions of this map. The FEMA Map Service Center may also b reached by Fax at 1-800-358-9620 and its website at <u>http://msc.fema.gov/</u>.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FBM MAP** (1-877-336-2627) or visit the FEMA website at <u>http://www.fema.gov/business/nfip/</u>.

The "profile base lines" depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data. the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Provionally Accredited Lavee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-specent-annual-chance level) and Emergency Action Plan, on the leve systems(s) shown as providing protection for areas on this panel. To maintain accreditation, the leve owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by May robumber of the data and documentation provided indicate the level system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the level system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodprofing or drive protective measures. For more information on flood insurance, interested parties should visit the FEMA Webste at http://www.fema.gon/basilistes/firty/accredites/firty/accred

1-PERCENT ANNUAL CHANCE OR GREATER FLOOD HAZARD BY A LEVEE SYSTEM THAT HAS BEEN PROVISIONALLY ACCREDITED.
